TITLE: Dry stable formation to produce microbubble suspension for ultrasound

Brief Summary Text (28) :

In a variant of the method, one may also start with dehydrated liposomes, i.e. liposomes which have been prepared normally by means of conventional techniques in the form of aqueous solutions and thereafter dehydrated by usual means, e.g. such as disclosed in U.S. Pat. No. 4,229,360 also incorporated herein as reference. One of the methods for dehydrating liposomes recommended in this reference is freeze-drying (lyophilization), i.e. the liposome solution is frozen and dried by evaporation (sublimation) under reduced pressure. Prior to effecting freeze-drying, a hydrophilic stabilizer compound is dissolved in the solution, for instance a carbohydrate like lactose or sucrose or a hydrophilic polymer like dextran, starch, PVP, PVA and the like. This is useful in the present invention since such hydrophilic compounds also aid in homogenizing the

TITLE: Method of dehydrating vesicle preparations for long term storage

Brief Summary Text (9):

Research directed to prolonging liposomal stability on storage has focused on liposome preservation in the form of lyophilization. Lyophilization refers to the process whereby a substance is prepared in dry form by rapid freezing and dehydration under high vacuum. Traditional wisdom dictates that phospholipid vesicles cannot be lyophilized successfully. Recent studies done by Drs. John and Lois Crowe at the University of California at Davis indicate that the disaccharide, trehalose, functions as a cryoprotectant during lyophilization and the studies conclude that optimal results are achieved when the cryoprotectant is located inside as well as outside the liposome. L. M. Crowe, et al., 1 Archives of Biochemistry and Physics 242 (1985). See also J. H. Crowe, L. M. Crowe, Cryobiology, 19, 317 (1982) In Biological Membranes, D. Chapman, Ed. (Academic Press, N.Y. 5, 57) in which it was reported that certain organisms such as nematodes, were able to survive dehydration in the presence of trehalose. Battelle Memorial Institute, Basel, has also disclosed the use of proteins and polysaccharides as liposome preservation agents during lyophilization, resulting in reported undamaged liposome levels of only approximately 70%. Schneider, et al., Process for the Dehydration of a Colloidal Dispersion of Liposomes, U.S. Pat. No. 4,229,360 (Oct. 21, 1980). Several other patents have been issued which disclose various methods to preserve liposomes utilizing lyophilization techniques. Evans, et al., Process for Preparing Freeze-Dried Liposome Compositions, U.S. Pat. No. 4,370,349 (Jan. 25, 1983); Weiner, et al., Storage-Stable Lipid Vesicles and Method of Preparation, U.S. Pat. No. 4,397,846 (Aug. 9, 1983); Vanlerberghe, et al., Storage Stability of Aqueous Dispersions of Spherules (Jan. 27, 1981). The stabilizing effect of sugars on sarcoplasmic reticulum subjected to freeze-drying and rehydration, and on microsomes and egg phosphatidylcholine SUV subjected to freeze-thawing have also previously been noted.

Current US Cross Reference Classification (3):

424/450
